Re: Transmittal Letter for First Semi-Annual 2012 Monitoring Report, Recology Hay Road, Solano County, California

Dear Ms. Boyd:

Enclosed is the above-referenced report. This transmittal letter includes the information required by Section E.2 *Reporting Requirements* of WDR/MRP Order R5-2008-0118.

No violations have been noted since the last report was submitted. However, there are results of note and these will be investigated further (see text below).

Wells G-8 and G-9 continue to exhibit barium above the concentration limits. The installation of landfill gas extraction in DM-1 is expected to reduce the barium in groundwater.

One VOC (dichlorodifluoromethane) was detected at estimated trace concentrations in well G-9. Because this is a single trace VOC detection, no further action is necessary at this time.

No VOCs were detected in any other western area well.

There were two eastern landfill area background monitoring wells that had an exceedance of an inorganic monitoring parameter, nitrate/nitrite as N in wells G-4R and G-18. These exceedances were noted in the previous monitoring reports. Improvements were made to the site surface water drainages in the area of each of these wells and the western half of the LTU has been clean closed. The drainage improvements and LTU closure are anticipated to reduce nitrate concentrations in runoff and reduce the opportunity for surface water to infiltrate in the area of these wells and result in increased nitrate concentrations.

Well G-19R had an ammonia concentration of 0.97 mg/l, which is slightly higher than the concentration limit of 0.9 mg/l. The well will be resampled during third quarter 2012. No other inorganic concentration limits were exceeded in eastern area wells. No VOCs were detected in eastern area wells.

Methane was not detected in any of the perimeter monitoring probes. Methane was detected at some interior probes.

Methane was detected above 1 percent in LD-3.2, PL-5.2, and PL-11.2, but no locations had organic vapor concentration greater than 1 ppm; TO-15 analyses were performed and several VOCs were detected. Adjustments will be made to the landfill gas extraction system in the area.

DM-11 Corrective Action Evaluation

The leachate levels in S-11.1 and S-11.2 were below 1 foot throughout the monitoring period. The water levels in PL-11.1 and PL-11.2 were at minimum levels throughout the monitoring period.

No VOCs were detected in PL-11.1. The concentrations of inorganic monitoring parameters are similar to previous monitoring results and the chloride concentration is the lowest to date, indicating improving water quality. To date there is no evidence that the VOCs detected in the pan lysimeters underlying DM-11 have reached groundwater.

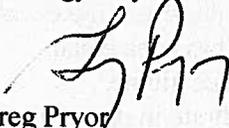

WP-9.1 Corrective Action Monitoring Evaluation

Throughout 2011, the leachate levels in S-9.1A and S-9.1B were maintained at levels below 1 foot. The water levels in the pan lysimeters remained at minimum levels throughout the monitoring period. Therefore, no water was removed from the pan lysimeters.

Approximately 592,500 gallons of groundwater were extracted using well G-22. The average groundwater extraction rate was 2.3 gallons per minute, which is slightly higher than the design extraction rate for the corrective action well. The nitrate concentration in adjacent monitoring well G-21 has been below the concentration limit since the second quarter of 2011, which indicates that the corrective actions have been effective at reducing the nitrate concentrations in well G-21.

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

Sincerely,
Recology Hay Road

Greg Pryor
Regional Landfill Manager

1.0 INTRODUCTION

On behalf of Recology Hay Road, Golder Associates Inc. is submitting this report, which presents the results of groundwater, vadose zone, surface water, leak detection, and landfill gas monitoring conducted at the Landfill (Figure 1) during the first and second quarter 2012 monitoring period. Results of the monitoring program, including groundwater flow and elevation data, sampling methods, analytical data, waste monitoring, and standard observations are included. The sampling and analysis program (Table 1) was performed in accordance with the Waste Discharge Requirements (WDRs) Order No. R5-2008-0188, adopted by the Regional Water Quality Control Board (RWQCB) Central Valley Region in December 2008.

2.0 SITE BACKGROUND

The Landfill consists of two Class III Landfills (Landfill 1 [LF-1] and Landfill 2 [LF-2]) and one Class II Landfill (Landfill 3 [LF-3]). LF-1 and LF-2 have one disposal module (DM) each (DM-1 and DM-2.1, respectively). LF-3 will have a total of 15 disposal modules when completed. Currently, DM-2.2, DM-3, DM-4, DM-5, and DM-11 are the only active disposal modules in LF-3. DM-9.1 (referred to as WP-9.1 in the WDR), comprised of 9.1A and 9.1B, is used for storing sludge. A Land Treatment Unit (LTU) is used for drying the sludge prior to re-use on site. Figure 2 shows the locations of these disposal modules.

The sediments beneath the site consist of sandy clay and silt, hundreds of feet thick, which locally contain zones of fine sand. Hydraulically, the sediments behave as one low-permeability groundwater body. The top of the groundwater body (i.e., the water table) occurs at a depth ranging from 5 to 15 feet beneath most of the site. Generally, groundwater flows slowly from the northwest to the southeast, following the regional direction of groundwater flow. Horizontal groundwater flow is more dominant than vertical flow, due to the clayey interbedded nature of the sediments, and is demonstrated by the similar water levels exhibited by wells that monitor different depth ranges.¹ Operation of a groundwater drain and dewatering of the borrow pit have significantly altered the movement of shallow groundwater beneath most of the site. Extraction of groundwater has created a cone of depression nearly one-quarter of a mile in diameter. Figures 2 and 3, groundwater contour maps based on first and second quarter groundwater elevations, shows the altered pattern of groundwater movement, and the locations of the groundwater drain and the borrow pit.

Groundwater monitoring has been conducted at the site since 1986. High concentrations of inorganic constituents in groundwater in the eastern area of the site were evaluated in 1995.² The conclusion of the groundwater quality evaluation was that high concentrations of dissolved inorganic constituents occur naturally in groundwater in the eastern area of the Landfill, and are generally coincident with the occurrence of Younger alluvium at the ground surface.

2.1 Corrective Action Monitoring Programs

There are two areas of the landfill that are currently operating under a corrective action monitoring program (CAP). These two areas are DM-11 and WP-9.1. In addition, two other areas of the landfill, DM-5.1 and DM-2.2A, were investigated for indications of a release. Each area is summarized below.

The Landfill has a targeted landfill gas (LFG) collection and control system that began operation on March 4, 2009. The LFG system consists of an enclosed flare, thirty eight (38) LFG extraction wells and ten (10) leachate sump risers outfitted for LFG extraction (see Figure 2 for LFG extraction well locations).

2.1.1 DM-11 Corrective Action Monitoring

Water was observed in pan lysimeter PL-11.1 (located beneath DM-11) in July 1999 and several VOCs were detected. An initial EFS was submitted to the RWQCB in August 2000.³ Water was first detected in PL-11.2 (located beneath DM-11.2) in April 2000 and several VOCs were also detected in pan lysimeter PL-11.2. An EMP was submitted in August 2000.⁴

The extent of impact from the water and VOCs detected in PL-11.1 and PL-11.2 was evaluated.⁵ Soil gas sampling showed that landfill gas was detected in one location along the southern edge of DM-2.1. In addition, VOCs were detected in a gas sample collected from within the PL-11.1 riser. The water levels in each pan lysimeter showed increases with seasonal rain events. No water appeared to be entering the pan lysimeters during relatively dry months.

Corrective action measures were implemented, including covering the exposed edges of the landfill module liner system with plastic sheeting to reduce the possibility of surface water from entering the capillary break layer. A change to the water quality monitoring program was proposed, making PL-11.1 and PL-11.2 part of the corrective action monitoring program. It was proposed that when water with VOCs is no longer entering the pan lysimeters, PL-11.1 and PL-11.2 would return to the detection monitoring program.

Additional information has been provided to the RWQCB regarding the release to PL-11.1 and PL-11.2.^{6,7} To address concerns regarding landfill gas migration from the landfill based on the presence of landfill gas found in the pan lysimeters and soil adjacent to DM-2.1, a revised landfill gas monitoring plan was developed for the site.⁸

In 2003, the Landfill evaluated the occurrence of landfill gas and assessed if gas constituents could migrate to waters of the State and cause a condition of nuisance, degradation, contamination or pollution, consistent with the requirements in the Landfill WDRs.⁹ The conclusions of the assessment report showed that gas constituents would not be expected to cause a condition of nuisance, degradation, contamination, or pollution in groundwater. A report to further explore landfill gas constituents was submitted on October 29, 2004 to the RWQCB that addressed the VOCs detected in the gas probes and pan lysimeters.¹⁰ A corrective action plan to address the landfill gas issues was submitted at the end of May 2005.¹¹ The LFG collection system was installed, partially, to control the landfill gas in the DM-11 area.

2.1.2 WP-9.1 Corrective Action Monitoring

Water was detected in the pan lysimeters (PL-9.1A and B) located beneath WP-9.1 in July 2000 and elevated concentrations of nitrate/nitrite as nitrogen (as N) were detected in water samples from both pan lysimeters.¹² An EMP was submitted to the RWQCB in July 2001.¹³ The results of the EMP were presented in an EFS, resulting in corrective actions to prevent surface water and leachate leakage from entering the Module 9.1 capillary break and pan lysimeters.¹⁴ These corrective actions included: (1) repair of the landfill liner hole found during a leak detection survey, and (2) covering the exposed edges of the landfill module liner system with plastic sheeting to reduce the possibility of surface water entering the capillary break layer.

As a result of elevated nitrate concentrations in detection monitoring well G-21, additional work was performed to investigate both the nature and extent of the release to the unsaturated zone and groundwater.¹⁵ Investigations were performed to complete the definition of the impact to groundwater and corrective actions were recommended.¹⁶ An addendum to the EFS for WP-9.1 was prepared to address RWQCB comments on the EFS.¹⁷ The corrective actions for WP-9.1 included excavation of nitrate-impacted soil, installation of a liner on the perimeter berm that was connected to the base liner to prevent water infiltration into the capillary break layer, the operations layer was retrofitted to enhance leachate movement through the operations layer, and ongoing groundwater extraction to control the nitrate-impacts to groundwater. The groundwater extraction well (G-22) and two additional monitoring wells (G-23 and G-24) were installed June 2003 to evaluate the effectiveness of the groundwater extraction in the next deeper sand layer and the downgradient edge of the plume.¹⁸ Well G-24 was properly destroyed in 2011 due to construction of DM-6. Approximately 1,500 cu. yds. of nitrate-impacted soil was excavated and removed in October 2002.

2.1.3 Disposal Module 2.2A and Pan Lysimeter PL-2.2A

Water was detected in PL-2.2A in April 2004 and four VOCs were detected at trace concentrations. The concentrations of inorganic parameters in the pan lysimeter water were much lower than the leachate concentrations, and the ionic character of the water in the pan lysimeter differed from the overlying leachate sump, indicating that the source of the water in the pan lysimeter was not likely leachate.¹⁹ As a continued corrective action measure, any water that enters the pan lysimeters is pumped out immediately. In addition, the targeted LFG collection system has reduced VOCs within the pan lysimeters.

2.1.4 Disposal Module 5.1A and Pan Lysimeter PL-5.1A

Water was detected in PL-5.1A in January 2005 and VOCs were detected in the water sample from PL-5.1A. The concentrations of inorganic parameters in the pan lysimeter water are much lower than the leachate concentrations, and the ionic character of the water in the pan lysimeter differed from the overlying leachate sump, indicating that the source of the water in the pan lysimeter is not likely

leachate.²⁰ As a continued corrective action measure, any water that enters the pan lysimeters is pumped out immediately. The LFG collection system was installed, partially, to control the landfill gas in the DM-11 area and has reduced VOCs within the pan lysimeters.

2.1.5 Disposal Module 5.1B and Pan Lysimeter PL-5.1B

Water was detected in PL-5.1B in April 2004 and VOCs were detected in the water sample from PL-5.1B. With the exception of tetrachloroethene, the VOCs detected in PL-5.1B were detected in the overlying leachate sump, S-5.1B. Concentrations detected in the PL-5.1B sample were roughly one-half of those detected in the leachate sample. The concentrations of inorganic parameters in the pan lysimeter water are also much lower than the leachate concentrations and the ionic character of the water in the pan lysimeter differed from the overlying leachate sump, indicating that the source of the water in the pan lysimeter is not likely leachate.²¹ As a continued corrective action measure, any water that enters the pan lysimeters is pumped out immediately. In addition, the targeted LFG collection system has reduced VOCs within the pan lysimeters.

3.0 GROUNDWATER ELEVATION AND FLOW

During first and second quarters, groundwater elevations were measured on January 18 and May 1, 2012. Water levels were measured in all site wells according to the general protocol described in Golder's Groundwater Sampling and Laboratory Procedures, and were recorded with the time of measurement on a water level data sheet (Appendix A). The water level in well D-3 could not be measured, because the well was damaged by a vehicle and the above ground casing was broken off. Well D-3 was properly destroyed on June 13 to 14, 2012. To calculate groundwater elevations, the water levels were subtracted from the top-of-casing elevations, which have been surveyed to mean sea level (MSL) (Table 2). Groundwater elevations are lower than the same period last year. Historical hydrographs are included in Appendix C.

Groundwater elevations, flow direction, gradient, and velocity are in accordance with historical observations. Groundwater elevation contours are shown on Figures 2 and 3. The steepest gradient is in the western portion of the landfill, where groundwater movement is influenced by the borrow pit and groundwater drain, and is calculated to be 0.01. In the eastern portion of the site, where the effects of groundwater extraction are less significant, the gradient is calculated to be approximately 0.002. The gradient in the eastern portion of the site is generally representative of the regional groundwater gradient.

3.1 Groundwater Velocity

Using the calculated gradients, the hydraulic conductivity, and the estimated effective porosity of the water-bearing zone, the approximate groundwater seepage velocity can be calculated using Darcy's Law. Based on results of field hydraulic testing in previous investigations, an average hydraulic conductivity of 5×10^{-3} centimeters per second (cm/s) is used for calculating groundwater velocity in the sandy sediments beneath the site. An effective porosity value of 0.15 for the sandy zones is assumed. Groundwater seepage velocity for the sandy sediments near the borrow pit is calculated to be 3×10^{-4} cm/s (340 feet per year [ft/yr]). At the eastern portion of the site, where the gradient is more natural, groundwater seepage velocity in sandy sediments is calculated to be 6×10^{-5} cm/s (60 ft/yr).

For estimating the groundwater seepage velocity for the fine-grained sediments beneath the site (sandy silts and clays), a conductivity value of 4.7×10^{-5} cm/s is taken from published literature about the site's regional hydrogeology. An effective porosity value of 0.3 for the fine-grained zones is assumed. Groundwater seepage velocity for the fine-grained sediments in the area near the active extraction is

²⁰ Golder Associates Inc., *Investigation For Pan Lysimeters PL-2.2A, PL-5.1A, and PL-5.1B, Norcal Waste Systems Hay Road Landfill Inc., Solano County, California*, July 18, 2005.

²¹ Golder Associates Inc., *Investigation For Pan Lysimeters PL-2.2A, PL-5.1A, and PL-5.1B, Norcal Waste Systems Hay Road Landfill Inc., Solano County, California*, July 18, 2005.

calculated to be 1.6×10^{-6} cm/s (2 ft/yr). At the eastern portion of the site, where the gradient is more natural, groundwater seepage velocity is calculated to be 2.7×10^{-7} cm/s (less than one ft/yr).

3.2 Disposal Module/Groundwater Separation

Reporting of the separation between groundwater and the lowest point of each disposal module is required in WDR R5-2003-0118. The lowest point of each disposal module is the leachate sump. Table 3 presents each module sump elevation, the estimated groundwater elevation at each sump interpolated from the groundwater contour maps, and the elevation differences between the sump and groundwater. Note that the groundwater elevations represent piezometric elevations and the actual separation between the sump and where groundwater would be encountered below the sump may be greater.

4.0 SAMPLING AND ANALYSIS PROGRAM

A summary of the current sampling and analysis program, based on MRP R5-2008-0188, is presented in Table 1; all monitoring points are shown on Figure 2. The monitoring program consists of groundwater detection monitoring, unsaturated zone monitoring, landfill gas monitoring, leachate monitoring, leak detection monitoring, and surface water monitoring.

4.1 Groundwater Monitoring

The groundwater detection monitoring network wells are sampled semi-annually. The wells are divided by the area of the landfill they monitor, western and eastern areas. In addition, there are three corrective action wells (G-21, G-22, and G-23) that are monitored quarterly. Note that detection monitoring well 4B was properly destroyed in June 2012 under Solano County Department of Resource Management permit; a replacement well (4BR) was installed north of DM-11. In addition, a new detection monitoring well (G-31) was installed south of new disposal module DM-6 to replace well G-14, which was destroyed in 2011.

Wells in the western area of the Landfill (G-1, G-2, G-6, G-8, G-9, G-10M or G-10R, G-11, G-11M or G-11R, G-12, G-13, G-17, G-27, 4B [replaced by well 4BR for future monitoring], MW-4, and P-1) are used for monitoring modules in the western part of the site (DM-1, DM-2.1, DM-2.2, DM-11.1, and DM-11.2).

The following sampling decision protocol was established in the *Amended ROWD Proposing Changes to the Detection Monitoring Program*²² to identify and sample the monitoring well with the best possibility of identifying a potential release from the landfill in the well G-10 and G-11 areas. The well sampling protocol is outlined below:

- Well G-27 will be sampled in place of well G-10, because the well will monitor the same depth zone, but inside the slurry wall.
- Well G-10M will be sampled in place of well G-10R, because the well will be screened in a shallower permeable layer.
- Well G-10R will only be sampled if well G-10M is dry as a result of low groundwater levels.
- The two shallowest wells with groundwater in the multiple depth wells G-11, G-11M, and G-11R will be sampled. Therefore, if wells G-11 and G-11M have sufficient groundwater to sample, then well G-11R will not be sampled.

Due to the spatial variability of groundwater beneath the site and the influence of the borrow pit dewatering, intrawell comparisons are used for statistical evaluation of monitoring data. Three methods are used to evaluate the analytical results: statistical, non-statistical, and graphical. The monitoring parameters are evaluated using statistical methods (nitrate/nitrite as nitrogen, arsenic, and chromium) or

²² Golder Associates Inc., *Amended ROWD Proposing Changes to the Detection Monitoring Program, Norcal Waste Systems Hay Road Landfill Inc.* May 31, 2005.

non-statistical methods (volatile organic compounds). Field parameters and supplemental parameters (chloride, sulfate, total dissolved solids, and the remaining major anions and cations [calcium, magnesium, potassium, sodium, and alkalinity]) are evaluated using graphical methods for water quality trends and ion balance (annual Piper diagram).

Wells in the eastern area of the Landfill (G-4R, G-6, G-16, G-17, G-18, G-19R, G-20, G-25, G-26, G-28, G-29, and G-30 [new well G-31 will be monitored in the future]) are used for monitoring the eastern part of the site (DM-3.1, DM-4.1, DM-5.1, DM-5.2, DM-9.1[WP-9.1], and LTU).

Because the groundwater flow in the eastern area of the site is influenced by the regional gradient, interwell comparisons are used for statistical evaluation of monitoring data. For the eastern area, wells G-4R, G-6, G-17, and G-18 are used as background wells. Statistical data evaluation methods (nitrate/nitrite as nitrogen, arsenic, and chromium) are used in the eastern area, with lead and biosolids parameters added to the statistical evaluations. Field parameters and supplemental parameters (chloride, sulfate, total dissolved solids, and the remaining major anions and cations) are evaluated annually using graphical methods for water quality trends and ion balance (annual Piper diagram).

4.2 Unsaturated Zone Monitoring

Suction lysimeter VZ-2.1, the unsaturated zone monitoring point for LF-2, is sampled semi-annually. Pan lysimeters PL-2.2A, PL-2.2B, PL-5.1A, PL-5.1B, PL-9.1A, PL-9.1B, PL-11.1 and PL-11.2 provide monitoring access to the secondary drainage layer (capillary break) under the corresponding disposal modules. Pan lysimeters PL-3.1, PL-3.2, PL-3.3, PL-4.1, and PL-5.2 provide monitoring access below the leak detection sumps. According to the MRP, most pan lysimeters, which are installed beneath leachate sumps, are checked for liquid semi-annually, and sampled if sufficient liquid is present. Landfill staff check the pan lysimeters for liquid monthly. As part of corrective action monitoring, liquid levels in pan lysimeters PL-9.1A, PL-9.1B, PL-11.1, and PL-11.2 are measured weekly. Pressure transducers, which can measure the height of water above the transducer, are installed in all pan lysimeters to provide a more reliable measurement of the amount of water in each pan lysimeter.

LTU unsaturated zone monitoring is conducted by obtaining one soil sample per acre of LTU used. Soil samples are obtained at a depth of 5- to 6-feet below ground surface. Background soil samples are obtained at the beginning of the sludge drying season, prior to the start of sludge application in May or June. Detection soil samples are obtained at approximately the same locations at the end of the drying season, after sludge is removed in October. If sufficient moisture is present in the soil samples, pore water is extracted for laboratory analyses of monitoring parameters. If sufficient moisture is not present, then the soil samples undergo soluble threshold limit concentration (STLC) extraction prior to laboratory analyses for monitoring parameters. The eastern LTU area (located between WP-9.1 and DM-5.2) was clean closed during 2011 in preparation for construction of DM-6.²³ Therefore, only the remaining western LTU area (located south of WP-9.1) was sampled during second quarter 2012.

4.3 Landfill Gas Monitoring

Landfill gas probes and all pan lysimeters and leak detection sumps are monitored semi-annually for methane, carbon dioxide, oxygen, and for organic vapors using field instruments. If, during the semiannual monitoring, greater than 1 percent methane or organic vapors are detected (concentration >1 ppm on field instrument) a gas sample is obtained and submitted for laboratory analysis of VOCs using EPA Method TO-15. Note that the perimeter landfill gas probes are monitored quarterly for landfill gas migration.

²³ Golder Associates Inc., Land Treatment Unit Clean Closure in Disposal Module DM-6 Footprint, Recology Hay Road, Vacaville, California, September 8, 2011.

4.4 Leachate Monitoring

Leachate is sampled annually at each disposal module sump (S-1, S-2.1, S-2.2A, S-2.2B, S-3.1, S-3.2, S-3.3, S-4.1, S-5.1A, S-5.1B, S-5.2, S-9.1A, S-9.1B, S-11.1, and S-11.2). In addition, leachate wells (and now combined landfill gas extraction wells) LW-1, LW-2, and LW-3, located in DM-1, are checked for leachate and sampled if sufficient leachate is available. Landfill staff check the sump levels at least monthly. As part of corrective action monitoring, liquid levels in sumps S-9.1A, S-9.1B, S-11.1, and S-11.2 are measured at least weekly by Landfill staff. Pressure transducers, which can measure the height of water above the transducer, are installed in all sumps to provide a more reliable measurement of the amount of leachate in each sump.

4.5 Surface Water Monitoring

Background monitoring point SW-4 is located in the A-1 Channel approximately 600 feet upstream of the Landfill drainage discharge point (Figure 2). Former background surface water monitoring point SW-3 was moved further upstream to the south side of the culvert that carries the A-1 Channel under Hay Road (Figure 2) and has been added to the monitoring program to provide a better background monitoring point upstream of SW-4. Location SW-5 monitors the bird sanctuary pond, which is primarily made up of surface water run-off from the site and discharge from the borrow pit dewatering. Location SW-7 monitors the A-1 Channel after the site discharge point.

Surface water locations are sampled semi-annually. The list of parameters and the laboratory method used for each analysis is included in Table 1.

4.5.1 Compost Area Pond

The compost area pond is located east of the compost area and south of WP-9.1 (Figure 2). The pond is sampled twice during the wet season for the parameters listed in Table 1.

4.6 Methods

Samples were collected according to the protocol described in the Groundwater Sampling and Laboratory Procedures²⁴ and the Site Specific Sampling and Analysis Plan,²⁵ with one exception regarding the collection of groundwater well samples, which is further described below. Details of well purging method, field parameter measurement, and sample collection at each sampling point are included on the water sample field data sheets in Appendix A. Field measurements of pH, specific conductance, temperature, and turbidity were taken and recorded on water sample field data sheets.

An alternative sampling procedure, utilizing dedicated tubing and a peristaltic pump, was proposed to reduce the turbidity of groundwater samples.²⁶ A combination of peristaltic pump (for low-flow purging and sampling for inorganic parameters) and disposable bailer (for VOC samples) were used to obtain water samples from the majority of the monitoring wells. Monitoring wells located near the borrow pit with water levels too deep to utilize a peristaltic pump were purged using a portable electric submersible pump. As a result of using this alternate sampling procedure, the turbidity values for the groundwater well samples were reduced significantly. Continued use of the peristaltic pump for groundwater well purging is recommended to maintain low turbidity values. Note that the depth to water in some wells (G-9, G-10M, G-11M, and G-11R) is too deep to use the peristaltic pump. Well 4B has insufficient water to use the peristaltic pump and was sampled using a disposable bailer.

²⁵ Conor Pacific, *Revised Site Specific Sampling and Analysis Plan, Hay Road Landfill, Solano County, California*, April 2002.

²⁶ Golder Associates Inc., February 12, 2010, *RWQCB Comments On Monitoring Reports, Recology Hay Road, Solano County, California*.

Samples were properly preserved and stored on the day of sampling. Chain-of-custody documentation accompanied the samples through collection and delivery to the analytical laboratory. Analyses were performed by BC Laboratories of Bakersfield, CA, a California state-certified analytical laboratory (CA ELAP Certificate Number 1186). Certified analytical reports are located in Appendix B.

4.7 Quality Control

As a field QA/QC measure, an equipment blank was collected during the sampling event using organic-free water supplied by the laboratory. The equipment blank was analyzed for VOCs by EPA Method 8260. Two VOCs were found in the equipment blank, but were not detected in any of the groundwater samples; chloroform was detected at a concentration of 5.5 µg/l and acetone was detected at a trace concentration of 5.5 µg/l.

Laboratory analyses occurred within recommended holding times and within laboratory quality control standards. Method blanks are expected to be non-detect, and the detection of an analyte in a method blank indicates laboratory sample contamination. Acetone was detected in a laboratory method blank that was not associated with the equipment blank batch. No other VOCs were detected in the laboratory method blanks. Trace concentrations of some inorganic parameters were detected in laboratory method blanks, but did not affect any site sample results.

5.0 MONITORING RESULTS

5.1 Groundwater Monitoring

Groundwater analytical results from first and second quarter 2012 are summarized in Tables 4, 6, 7 and 8. To evaluate groundwater quality, concentration limits for the monitoring parameters are compared to the analytical results. The concentration limits have been calculated using analytical data through fourth quarter 2011 for the western area (Table 4) and second quarter 2012 for the eastern area (Tables 6 and 7). The concentration limits were calculated using intrawell (western area) or interwell (eastern area) tolerance limits at 95% confidence and 95% coverage. Analytical results for this quarter with respect to the concentration limits are discussed below for the two landfill areas.

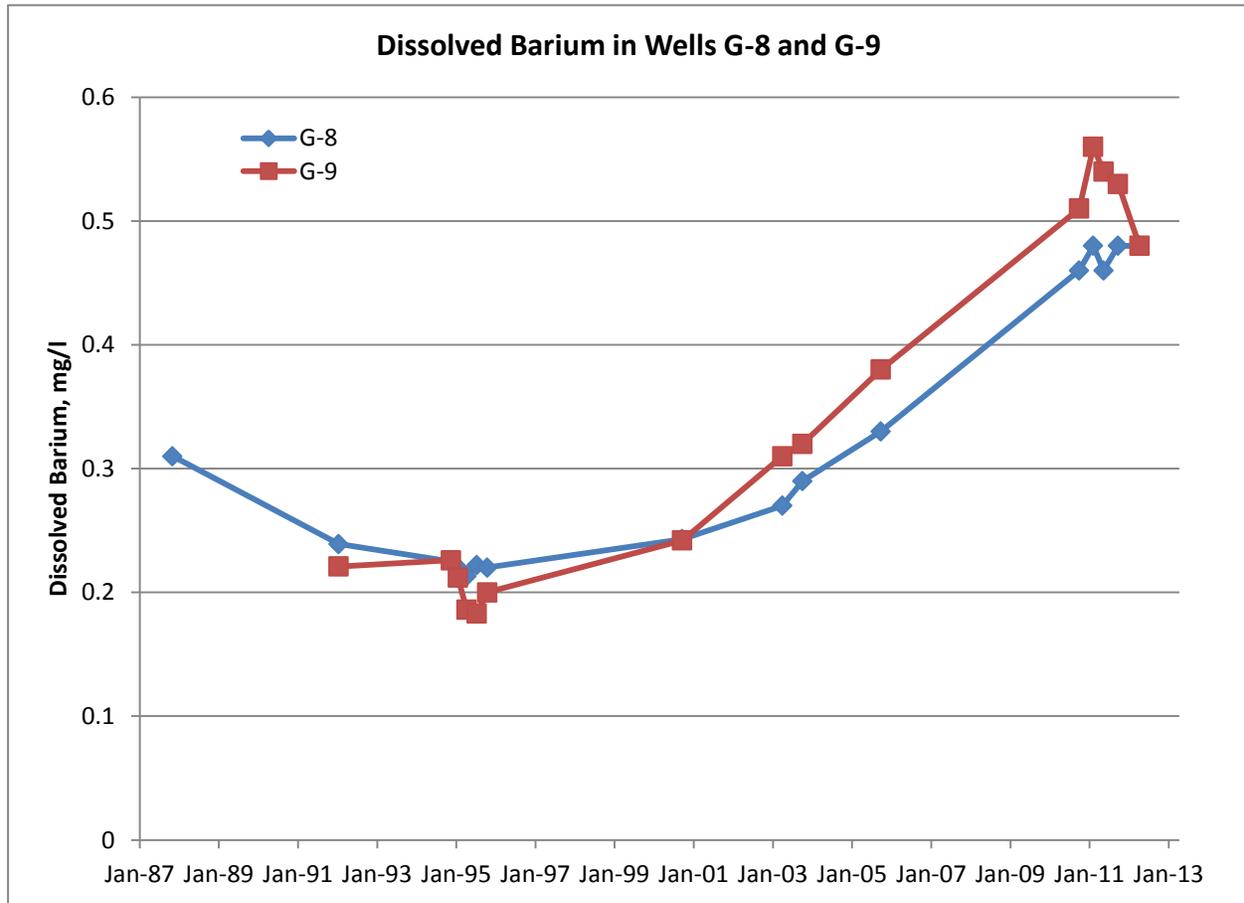

5.1.1 Western Landfill Area

Western area monitoring wells were sampled in May 2012. The disposal modules monitored in the western area include DM-1, DM-2.1, DM-2.2, DM-11.1 and DM-11.2. Samples from all wells were analyzed for routine monitoring parameters.

One VOC (dichlorodifluoromethane) was detected at an estimated trace concentration in well G-9. Because this is a single trace VOC detection, no further action is necessary at this time. No other VOCs were detected in any other western area well. However, dichlorodifluoromethane is a common landfill gas constituent and the well G-9 area is suspected to be influenced by landfill gas (see barium discussion below).

Barium was analyzed for in wells G-8 and G-9 to track the previous detections above the concentration limits. An EMP for wells G-8 and G-9 was submitted in June 2011 that concluded the increased barium concentrations were the result of landfill gas migration from DM-1.²⁷ The second quarter 2012 barium concentrations were similar to previous results for well G-8 and show a decreasing trend for recent results in well G-9 (see chart below). The installation of landfill gas extraction wells in DM-1 is anticipated to reduce the barium concentrations.

²⁷ Golder Associates Inc., June 21, 2011, *Amendment to Report of Waste Discharge and Establishment of Evaluation Monitoring Program for Dissolved Barium Detections in Monitoring Wells G-8 and G-9, Recology Hay Road, Vacaville, California.*

No other inorganic parameters were detected above their respective concentration limits.

Both increasing and decreasing trends were observed for inorganic constituents in several of the western area wells (Table 5). Most of the increasing trends can be attributed to the flow of groundwater with higher dissolved concentrations toward the area of borrow pit dewatering. As stated in previous monitoring reports, the higher concentrations of inorganic constituents in groundwater in the eastern area of the site are believed to be a result of spatial variability. Operation of the groundwater drain and dewatering of the borrow pit have significantly altered the movement of shallow groundwater beneath most of the site, causing groundwater to flow from the east (area of higher dissolved inorganics) toward the west. Note that there are increasing trends for bicarbonate alkalinity in two wells adjacent to DM-1; wells 4B and G-8. Landfill gas is often associated with increases in bicarbonate alkalinity in groundwater. As stated above, landfill gas extraction wells were installed in DM-1 at the end of May 2011 and should reduce the impact from landfill gas migration.

5.1.2 Eastern Landfill Area

Eastern area corrective action monitoring wells were sampled in January 2012 and May 2012 and the detection monitoring wells were sampled in May 2012. The disposal modules monitored in the eastern area include DM-3, DM-4, DM-5, and WP-9.1. Samples from all wells were analyzed for routine monitoring parameters.

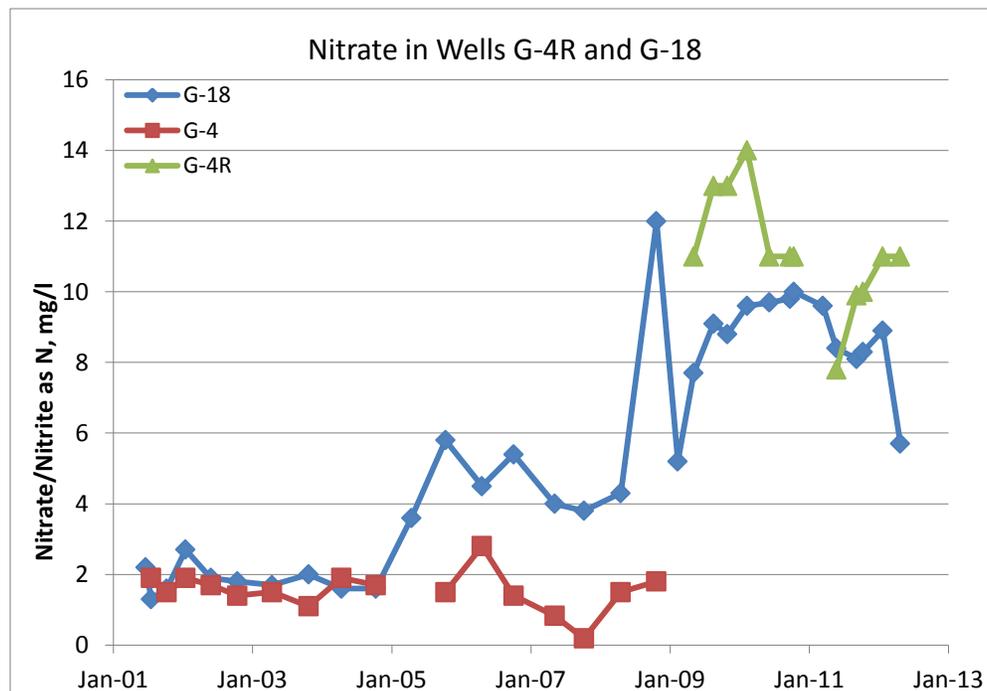

5.1.2.1 Background Wells

Background wells G-4R, G-6, G-17, and G-18 were sampled in May 2012 for routine monitoring parameters. Wells G-4R and G-18 were also sampled in January 2012 as part of the EMP²⁸ for nitrate/nitrite as N concentration limit exceedances detected during second quarter 2009 (Table 6). The sample results are discussed below. In general, the composition of the groundwater from the eastern area background wells is typical of the high TDS groundwater defined in the 1995 *Spatial Variability Report*.²⁹

Interwell concentration limits were then calculated using pooled data from the four background wells. To minimize the influence of the abundant historical data from well G-6, only recent data (2001 - 2012) was used. In addition, elevated nitrate data from wells G-4R and G-18 were not used. Concentration limits are presented on Tables 6 and 7.

The groundwater samples obtained from wells G-4R and G-18 had nitrate/nitrite as N concentrations above the concentration limit of 5 mg/l. EMPs were previously prepared for each well, and recommendations were made to monitor each well quarterly for nitrate/nitrite as N, unless the nitrate/nitrite as N concentration drops below the concentration limit.³⁰ Then, the well(s) should return to routine semi-annual monitoring. If the nitrate/nitrite concentrations as N remain elevated or increase, then a schedule to complete an EFS will be submitted to the RWQCB. The recent nitrate results in both wells G-4R and G-18 are lower than the nitrate concentrations from 2010 (see chart below). Note that improvements were made to the site surface water drainages in the area of each of these wells and the western half of the LTU has been clean closed. The drainage improvements and LTU closure are anticipated to reduce nitrate concentrations in runoff and reduce the opportunity for surface water to infiltrate in the area of these wells and result in increased nitrate concentrations.

²⁸ Golder Associates Inc., *Amendment to Report of Waste Discharge and Establishment of Evaluation Monitoring Program for Nitrate Detections in Monitoring Wells G-4R and G-18, Recology Hay Road, Solano County, California*, October 12, 2009.

²⁹ Einarson Geoscience, Inc. November 1995.

³⁰ Golder Associates Inc., *Amendment to Report of Waste Discharge and Establishment of Evaluation Monitoring Program for Nitrate Detections in Monitoring Wells G-4R and G-18, Recology Hay Road, Solano County, California*, October 12, 2009.

No other inorganic concentration limits were exceeded. No VOCs were detected in any of the eastern area background wells.

5.1.2.2 Detection Monitoring Wells

The eastern area detection wells were sampled in May 2012, and samples were analyzed for routine monitoring parameters (Table 7).

One inorganic concentration limit was exceeded during the monitoring period. The ammonia concentration in well G-19R was 0.97 mg/l, which is slightly higher than the concentration limit of 0.9 mg/l. The historical ammonia concentrations in well G-19R do not exhibit a trend. The ammonia in well G-19R may be the result of migration of nitrogen from WP-9.1 or the previous leakage from the compost area pond. Well G-19R will be re-sampled during third quarter and analyzed for nitrogen compounds, ammonia, nitrate, and TKN. Well G-26, which is located downgradient from well G-19R, had a trace ammonia concentration of 0.041 mg/l.

There were no VOC detections in eastern area wells and no other inorganic concentration limits were exceeded.

The eastern portion of the LTU was clean closed during the summer of 2011, which included excavation of LTU-impacted soil and removal of the sludge storage stockpile. Disposal module DM-6 will be constructed in the former LTU footprint. Monitoring well G-14 was properly destroyed in July 2011, because the well is in the DM-6 footprint. New monitoring well G-31, constructed along the southern edge of DM-6, was installed in June 2012 to replace well G-14.

5.1.2.3 Corrective Action Monitoring Wells

Corrective action wells G-21, G-22, and G-23 were sampled quarterly. The nature and extent of elevated nitrate concentrations in groundwater downgradient of WP-9.1 and well G-21 was previously defined and corrective actions were implemented.³¹ A groundwater extraction well (G-22) was installed adjacent to well G-21 in June 2003 to control the migration of nitrate-impacted groundwater. In addition, a deeper corrective action monitoring well (G-23) and a downgradient corrective action monitoring well (G-24) were installed in June 2003. Monitoring well G-24 was properly destroyed in July 2011, because the well is in the DM-6 footprint.

Analytical results from these wells are presented in Table 8. Well G-21 had nitrate concentrations of 3.0 and 3.9 mg/l during first and second quarters, respectively. These nitrate concentrations in well G-21 are below the concentration limit, indicating that the corrective actions have effectively reduced nitrate concentrations in well G-21. The extraction well (G-22) had nitrate concentrations of 17 and 21 mg/l, substantially lower than historical results. The deeper well (G-23) had low nitrate concentrations (2 mg/l during each quarter), indicating that the nitrate contamination has remained shallow. These wells will continue to be sampled quarterly to monitor the effectiveness of the corrective actions.

During January through June 2012, approximately 592,500 gallons of groundwater were extracted from well G-22. The groundwater extraction rate was approximately 2.3 gallons per minute, which is slightly higher than the design extraction rate for the corrective action well. The water was transported to the City of Vacaville's waste water treatment plant for disposal.

5.2 Vadose Zone and Leak Detection Sump Monitoring

Vadose zone monitoring points were sampled in May 2012, if water was present. Analytical results are summarized in Table 9.

³¹ Conor Pacific, November 14, 2002 and Conor Pacific, *Addendum to Revised Engineering Feasibility Study for Waste Pile 9.1, Norcal Waste Systems Hay Road Landfill Inc., Solano County, California*, January 15, 2003.

5.2.1 Suction Lysimeter Monitoring

Suction lysimeter VZ-2.1, which monitors the unsaturated zone beneath DM-2.1, was dry and no sample was obtained.

5.2.2 Pan Lysimeter and Leak Detection Sump Monitoring

Pan lysimeters, which are installed beneath leachate sumps, provide monitoring access to the secondary drainage layer (capillary break) under the disposal modules, with the exception of PL-3.1, PL-3.2, PL-3.3, PL-4.1, and PL-5.2, which were constructed to provide monitoring access below the leak detection sumps. The liquid level is checked semi-annually by Golder Associates, and sampled if sufficient liquid is present. Landfill staff check the pan lysimeters for liquid at least monthly, and as part of corrective action monitoring, liquid levels in pan lysimeters PL-9.1A, PL-9.1B, PL-11.1, and PL-11.2 are measured at least weekly by Landfill staff. In addition to routine monitoring, if increases in water levels are observed in a previously dry pan lysimeter, then the water in the pan lysimeter is sampled and analyzed for routine monitoring parameters. Any liquid that is pumped from the pan lysimeters is recorded by Landfill staff. A field log of depth to liquid measurements or height of water above the transducers, and pumping data is provided in Appendix A.

5.2.2.1 PL-2.2A and PL-2.2B

Pan lysimeters PL-2.2A and PL-2.2B had insufficient water to obtain samples. The water levels in PL-2.2A and PL-2.2B remained at minimum levels throughout the monitoring period.

5.2.2.2 PL-3.1, PL-3.2, PL-3.3, LD-3.1, LD-3.2, and LD-3.3

PL-3.1, PL-3.2, PL-3.3, LD-3.1, and LD-3.3 had insufficient water to obtain a sample. The water levels remained at minimum levels throughout the monitoring period. LD-3.2 was sampled for routine monitoring parameters. The chloride concentration in LD-3.2 was 68 mg/l, the bicarbonate alkalinity concentration was 440 mg/l, and the TDS concentration was 620 mg/l. This water sample obtained from LD-3.2 is likely consolidation water from the weight of the newly placed waste in the module.

5.2.2.3 PL-4.1 and LD-4.1

PL-4.1 had insufficient water to obtain a sample. LD-4.1 was sampled on May 8, 2012. The water level in PL-4.1 and LD-4.1 remained at minimum levels throughout the monitoring period. The chloride concentration in LD-4.1 was 94 mg/l, the bicarbonate alkalinity concentration was 390 mg/l, and the TDS concentration was 1,400 mg/l. This water sample obtained from LD-4.1 is likely consolidation water from the weight of the newly placed waste in the module.

5.2.2.4 PL-5.1A and PL-5.1B

PL-5.1B was dry and no sample was obtained. PL-5.1A was sampled for routine monitoring parameters on May 8, 2012. The water in PL-5.1A and PL-5.1B remained at minimum levels throughout the monitoring period. No VOCs were detected in PL-5.1A. The concentrations of most inorganic parameters in PL-5.1A are much lower than the leachate concentrations in the overlying sumps (S-5.1A and S-5.1B), indicating that the source of the water in the pan lysimeter is not likely leachate.

5.2.2.5 PL-5.2 and LD-5.2

Throughout the monitoring period, PL-5.2 and LD-5.2 were dry and no samples were collected. The water levels in PL-5.2 remained at minimum levels throughout the monitoring period.

5.2.2.6 PL-9.1A and PL-9.1B

Pan lysimeter PL-9.1A was sampled and PL-9.1B was dry and no sample was obtained. The water levels in PL-9.1A and PL-9.1B remained minimal throughout the monitoring period. Results are summarized on Table 9.

The total nitrogen (ammonia, nitrate, or TKN) concentrations in the PL-9.1A water sample are lower than historical concentrations. All inorganic compounds in PL-9.1A have downward trends or no trend, except for arsenic (see trend analysis results in Appendix C). Note that an upward trend was calculated for arsenic, but this is due to older detections and arsenic has not been detected in PL-9.1A since 2009.

5.2.2.7 PL-11.1 and PL-11.2

PL-11.2 was dry and no sample was collected. PL-11.1 was sampled on May 8, 2012. The water levels in PL-11.1 and PL-11.2 remained at minimum levels throughout the monitoring period (Appendix A). No VOCs were detected in the PL-11.1 water sample. The concentrations of inorganic monitoring parameters are similar to previous monitoring results and the chloride concentration is the lowest to date, indicating improving water quality.

5.2.3 Land Treatment Unit

Unsaturated zone monitoring was conducted for the LTU in May 2012. Background borings were drilled and soil samples were collected prior to the drying season (prior to sludge application). Soil samples were obtained at a depth of 5.5 to 6 feet at four post-drying locations beneath the current western portion of the LTU area; soil sample locations are shown on Figure 4. The other six locations are now covered by the future DM-6 construction area, which was clean-closed in 2011. Soil samples were analyzed for routine monitoring parameters. Because there was insufficient moisture in the samples to perform pore water extraction, analyses were performed on the soil samples using the STLC extraction method (soluble threshold limit concentration extraction).

Concentration limits for routine monitoring parameters were calculated using pooled data from all of the background samples obtained in May 2012 (Table 10). Post-drying soil sample analytical results will be compared to the calculated concentration limits.

5.3 Landfill Gas Monitoring

Landfill gas probes and all pan lysimeters and leak detection sumps were monitored in second quarter for methane, carbon dioxide, oxygen, and organic vapors using field instruments (see field sheets in Appendix A). Results are summarized in Table 11. Perimeter landfill gas probes were monitored in both first and second quarters.

During the first and second quarter monitoring periods, methane was not detected in any of the perimeter monitoring probes. Methane was detected at low levels in some of the interior probes (GP-2, GP-3, and GP-4). No VOCs were detected in the perimeter monitoring probes.

LD-3.2, PL-5.2, and PL-11.2 had methane concentrations greater than 1 percent, but none of the vadose zone monitoring points had organic vapor concentration greater than 1 ppm. As a result of these methane measurements, samples were obtained at each location for quantification of VOCs using EPA Method TO-15 (Table 11). Several VOCs were detected in each sample. Adjustments will be made to the landfill gas extraction system to address these measurements.

5.4 Surface Water Monitoring

Surface water monitoring locations, SW-3, SW-4, SW-5, and SW-7, were sampled in May 2012. Analytical results are summarized in Table 12. Concentration limits have been calculated as interpoint tolerance limits at 95% confidence and 95% coverage using historical data from upstream location SW-4 through second quarter 2012 (Table 12). Due to a laboratory error, the sample from SW-7 was not analyzed for TSS.

No inorganic monitoring parameters were detected above their respective concentration limits. One trace VOC was detected in the background surface water sample location; SW-4 had chloroform at 0.15 µg/l. No VOCs were detected in any of the downstream surface water samples.

5.4.1 Compost Area Pond

The compost area pond was sampled twice during the monitoring period, on January 30 and May 8, 2012. The analytical results are summarized in Table 12. Due to a sampling error, the compost water sample was not analyzed for nitrite during second quarter. The water in the pond has elevated concentrations of inorganic parameters

5.5 Leachate Monitoring

Leachate monitoring is conducted annually during the second semi-annual monitoring event. Transducers are installed in all site leachate sumps and the height of water above the transducer (approximate sump bottom) for leachate sumps are collected at least monthly (at least weekly in sumps overlying pan lysimeters in corrective action) by Landfill staff (Appendix A). Measurements taken by Landfill staff are recorded on field logs, copies of which are included in Appendix A. Maximum monthly measurements are included in Table 13. Table 13 and the field logs include the height (feet) of leachate above the pressure transducer.

5.5.1 Leachate Extraction

The leachate sumps (S-1, S-2.1, S-2.2A, S-2.2B, S-3.1, S-3.2, S-3.3, S-4.1, S-5.1A, S-5.1B, S-5.2, S-9.1A, S-9.1B, S-11.1, and S-11.2) are equipped with pumping systems that require ten inches of fluid to operate. When present, liquid is extracted from the leachate sumps and is either used as dust control on the lined portions of the Landfill or is transported to the City of Vacaville's wastewater treatment plant.

Leachate extraction volumes, rates, and leachate levels in each sump are summarized in Table 13. Leachate volume measurements are recorded when leachate is removed from the leachate storage tanks and therefore the values on Table 13 do not necessarily correspond to when the leachate was pumped out of a specific sump. Approximately 1,119,600 gallons of leachate were removed from the Landfill during the first half of 2012. The leachate was discharged to the Vacaville Wastewater Treatment Facility.

5.5.2 Effectiveness of the Leachate Monitoring and Control Facilities

To evaluate the effectiveness of leachate removal, leachate levels in the sumps are monitored by landfill personnel using pressure transducers. Measurements are recorded on field logs, copies of which are included in Appendix A. The field logs include the maximum allowable depth of leachate in accordance with the WDR specifications. Leachate measurements indicate that the leachate levels in the sumps were in compliance during first and second quarters. No evidence of a leachate release or leachate seeps were identified.

As the leachate depths were maintained at appropriate levels, the drainage layers are not clogged, and no leachate releases or seeps were identified, the leachate control facilities appear to have been functioning properly and effectively.

5.5.3 Effectiveness of the Run-off/run-on Control Facilities

Surface water run-on does not occur at the landfill, as the site is located on flat topography. Precipitation or run-off that comes in contact with an active area of the landfill containing waste is directed to the leachate collection recovery system (LCRS) using earthen berms and drains constructed in the operations layer.

Surface water run-off that results from precipitation on covered portions of the Landfill and around the Landfill is routed via drainage ditches to the bird sanctuary pond. Standard observation logs provided by Landfill personnel indicate that no impacts to receiving waters were observed, and no evidence of liquid leaving or entering the perimeter of the waste unit was recorded. Therefore, run-off controls were effective during this monitoring period.

6.0 OPERATIONS MONITORING

The following operations monitoring data have been provided by Landfill staff. The annual storm water monitoring report is included in Appendix D.

6.1 Landfill

During first and second quarter 2012, weekly standard observations were conducted by Landfill staff for the waste management unit (WMU), perimeter of the WMU, and receiving waters. Standard observation records are included in Appendix A. No issues were reported on the observation forms. Run-off control facilities throughout the landfill were effectively conveying storm water to designated discharge points.

Based on daily scale readings, a total of 125,165 tons of refuse (not including diverted materials) were disposed of at a minimum elevation of 43 feet MSL. The refuse was placed in DM-3. In addition, 10,767.53 tons of asbestos were placed in DM-1. The annual waste placement area maps are updated annually in the Spring. The Spring 2012 waste placement maps that cover the period from April 2011 to May 2012 are included in Appendix A.

6.2 Waste Pile (DM-9.1 [WP-9.1])

In the waste pile (DM-9.1 [WP-9.1]), 33,670 wet tons of de-watered sewage sludge were placed. The moisture content was 80% to 85%. At the end of June 2012, the waste pile had 5% capacity remaining.

6.3 Land Treatment Unit

The following monitoring information was recorded by Landfill staff regarding sludge placement in the LTU during January through June 2012.

- Sludge depth: 8 to 12 inches
- Quantity discharged: 15,495 wet tons, or 17,216 cubic yards
- Location: western portion of LTU and top of DM-5 and DM-3.3
- Quantity removed: 3,646 tons, or 4,051 cubic yards
- Moisture content: approximately 10 - 15 percent
- Disposition: stockpiled
- Final sludge depth: 0 inches
- Total drying cycles: 3 cycles
- Cumulative LTU area covered: 2 acres

6.4 Borrow Pit

From January through June 2012 approximately 75,718,200 gallons of groundwater were extracted from the borrow pit. The extracted groundwater was used for dust control, composting operations and discharged to the A-1 Channel under NPDES permit R5-2008-0082-019 that was issued on May 19, 2011. Quarterly NPDES monitoring reports are submitted to the RWQCB, separately.

7.0 SUMMARY

A summary of key monitoring results obtained in first half of 2012 is presented below.

7.1 Routine Monitoring Summary

The following were noted for routine monitoring locations:

- Wells G-8 and G-9 continued to have dissolved barium above the concentrations limit. These barium detections are thought to be a result of landfill gas migration. Landfill gas

- extraction wells were recently installed in DM-1 and the barium concentrations are expected to decline as the gas extraction becomes effective.
- The groundwater samples obtained from background wells G-4R and G-18 continued to have nitrate/nitrite as N concentrations above the concentration limit. The recent nitrate results in both wells G-4R and G-18 are lower than the nitrate concentrations from 2010. Corrective actions to improve surface water drainage in the area of these wells have been implemented.
 - Well G-19R had an ammonia concentration of 0.97 mg/l, which is slightly higher than the concentration limit of 0.9 mg/l. The well will be resampled during third quarter 2012.
 - Wells 4B and D-3 were properly destroyed. New wells 4BR and G-31 were installed to replace wells 4B and G-14.
 - There were no other concentration limit exceedances in the monitoring wells.
 - No VOCs were detected above the reporting limit in the monitoring wells.
 - Methane was not detected in any of the perimeter monitoring probes. Methane was detected at some interior probes.
 - Methane was detected above 1 percent in LD-3.2, PL-5.2, and PL-11.2, but no locations had organic vapor concentration greater than 1 ppm; TO-15 analyses were performed and several VOCs were detected.

7.2 Corrective Action Monitoring Summary

Corrective actions have been implemented at DM-11 and WP-9.1 to prevent water (leachate and/or surface water) from entering the capillary break layer and pan lysimeters. Groundwater extraction downgradient of WP-9.1 began in June 2003. The following evaluates the monitoring data with respect to the effectiveness of the corrective actions to control releases from the landfill.

7.2.1 DM-11 Corrective Action Evaluation

- The leachate levels in S-11.1 and S-11.2 were below 1 foot throughout the monitoring period.
- The water levels in PL-11.1 and PL-11.2 were at minimum levels throughout the monitoring period.
- No VOCs were detected in PL-11.1. The concentrations of inorganic monitoring parameters are similar to previous monitoring results and the chloride concentration is the lowest to date, indicating improving water quality.

7.2.2 WP-9.1 Corrective Action Monitoring Evaluation

- Throughout the monitoring period, the leachate levels in S-9.1A and S-9.1B were maintained below 1 foot
- The water levels in the pan lysimeters remained at minimum levels throughout the monitoring period. Therefore, no water was removed from the pan lysimeters.
- Approximately 592,500 gallons of groundwater were extracted during this monitoring period using well G-22. The average groundwater extraction rate was 2.3 gallons per minute, which is slightly higher than the design extraction rate for the corrective action well.

7.2.3 Landfill Gas Collection System

The landfill gas (LFG) collection and control system is designed and operated to control landfill gas migration. The system began operation in March 2009 and was expanded into DM-1 in May 2011. The LFG system consists of an enclosed flare, thirty eight (38) extraction wells, and ten (10) leachate sump risers (see Figure 2 for LFG extraction well locations).

Program summary per Monitoring and Reporting Program No. R5-2008-0188

SA = Semi-annually; A = Annually; M = Monthly; W = Weekly; NA = Not Applicable; Twice = twice per year.

Semi-annual monitoring is conducted during second and fourth quarters. Annual monitoring is completed during the fourth quarter.

Metals include: Al, Sb, Ba, Be, Cd, Cr, Co, Cu, Fe, Mn, Ag, Sn, V, Zn, As, Pb, Hg, Ni, Se, Tl.

Next five-year COC sampling and analysis event scheduled for Fourth Quarter 2015.

Groundwater, vadose zone, and leachate samples for metals to be filtered and reported as dissolved concentrations.

* Eastern Area background wells

VOCs = volatile organic compounds

SVOCs = semi-volatile organic compounds

b. Attempt to sample any leachate in the leachate wells LW-1, LW-2, and LW-3.

d. Leachate detected in a previously dry sump or seep shall be sampled for COCs.

e. Soil samples taken before sludge drying season and after drying season.

f. Soil samples analyzed using WET extraction if soil pore water samples cannot be extracted from soil.

i. Well P-1 has replaced damaged well MW-3 as a detection monitoring point.

j. If >1ppm organic vapors detected, obtain gas sample for VOC analysis (TO-15).

k. If liquid present in leak detection sump, analyze for TDS, Cl, bicarbonate.

l. G-27 replaced G-10, G-10M replaced G-10R if water to sample,
two shallowest wells with water sampled for G-11, G-11M, and G-11R

m. Pan lysimeters for DM-11.1 and DM-11.2 are monitored weekly for depth and volumes pumped.

n. Twice annually during the wet season.

µg/l - micrograms per liter (parts per billion)

µmhos/cm - micromhos per centimeter at 25 °C

NTU - nephelometric turbidity units

t - trace, estimated value between the method detection limit and the reporting limit.

NA - Not Analyzed

NE - None established; insufficient data or too few detections.

ND - Non-detect; there have been no previous detections of this parameter.

Concentration limits calculated using historical data through fourth quarter 2011 with intrawell tolerance limits at 95% confidence and 95% coverage.

Trend analysis covering the previous 5 years (2008-2012).

Down: Statistically significant decreasing trend.

Up: Statistically significant increasing trend.

Dash indicates no significant trend.

NA - Not analyzed because less than 4 values have been obtained, or less than 4 detected values.

ND - Not detected during time period analyzed.

<u>Volatile Organic Compounds</u>												
All compounds below method detection limits.												

mg/l - milligrams per liter (parts per million)

Bold values exceed calculated concentration limit.

µg/l - micrograms per liter (parts per billion)

µmhos/cm - micromhos per centimeter at 25 °C

NTU - Nephelometric Turbidity Units

NA - not analyzed

NE - None established; insufficient data or too few detections.

Concentration limits calculated using pooled data from background wells obtained during 2001 - 2Q2012.

Wells G-14 and G-24 were destroyed in August, 2011 to allow the construction of disposal module DM-6

t - trace, estimated value between the method detection limit and the reporting limit.

Extraction Well G-22		Jan	Feb	Mar	Apr	May	NA	
Volume Pumped*	gallons	98,500	113,000	103,500	91,000	89,000	97,500	592,500
Average Extraction Rate	gpd	3,177	3,897	3,339	3,033	2,871	3,250	3,220
	gpm	2.2	2.7	2.3	2.1	2.0	2.3	2.3

mg/l - milligrams per liter (parts per million)

µmhos/cm - micromhos per centimeter at 25 °C

NTU - Nephelometric Turbidity Units

µg/l - micrograms per liter (parts per billion)

gpd = gallons per day

* - note that volume pumped can be derived from tanker truck volumes removed, which can result in skewed volumes from month to month

Well G-22 is the corrective action groundwater extraction well.

Well G-23 is the corrective action monitoring well installed in the next deeper sand layer adjacent to G-21.

Well G-24 was destroyed in July 2011, because the well was in the construction footprint for DM-6

Bold values exceed concentration limits.

Concentration limit calculated using pooled data from background wells obtained during 2001-2Q2012.

Wells G-14 and G-24 were destroyed in August, 2011 to allow the construction of disposal module DM-6

Volatile Organic Compounds by EPA Method TO-15

Sample Designation	units	PL-11.2 5/18/12	PL-5.2 5/18/12	LD-3.2 5/18/12
Freon 12	ppbv	2.8	0.84	3.0
Vinyl Chloride	ppbv	1.9	<0.71	<0.78
Freon 11	ppbv	<0.72	<0.71	6.2
Acetone	ppbv	90	220	180
Carbon Disulfide	ppbv	<2.9	<2.8	9.1
Methyl tert-butyl ether	ppbv	1.7	<0.71	<0.78
Hexane	ppbv	6.1	<0.71	2.8
1,1-Dichloroethane	ppbv	2.2	<0.71	<0.78
2-Butanone (MEK)	ppbv	<2.9	4.7	7.2
cis-1,2-Dichloroethene	ppbv	0.81	<0.71	1.1
Chloroform	ppbv	<0.72	0.86	<0.78
Tetrahydrofuran	ppbv	5.1	3.5	10
Cyclohexane	ppbv	5.0	<0.71	3.1
2,2,4-Trimethylpentane	ppbv	9.5	<0.71	0.85
Benzene	ppbv	2.5	1.1	1.7
Heptane	ppbv	1.1	1.5	2.2
Toluene	ppbv	12	13	20
Tetrachloroethene	ppbv	1.8	<0.71	<0.78
Ethyl Benzene	ppbv	3.0	3.3	4.1
m,p-Xylene	ppbv	14	15	18
o-Xylene	ppbv	4.4	4.8	5.7
Styrene	ppbv	0.82	1.1	1.0
Propylbenzene	ppbv	1.0	<0.71	1.0
4-Ethyltoluene	ppbv	4.3	5.0	4.9
1,3,5-Trimethylbenzene	ppbv	1.6	2.1	1.9
1,2,4-Trimethylbenzene	ppbv	6.5	8.2	7.0

ppm - parts per million

ppbv - part per billion by volume

NA - not analyzed, organic vapor field measurement < 1 ppm.

EPA TO-15 analysis if organic vapor field measurement > 1 ppm.

Table 12
Surface Water Analytical Results
First and Second Quarter 2012
Recology Hay Road

Sample Designation	SW-3	SW-4	SW-5	SW-7	Surface Water Concentration Limit	Compost Area Pond 1/30/12	5/8/12
Field Parameters							
pH	7.58	6.96	7.40	6.97	6.5 - 9.4	7.57	6.97
Specific Conductance	903	895	946	893	3,319	2,947	3,219
Temperature	22.6	23.4	23.5	24.3	-	13.1	23.6

Total Kjeldahl Nitrogen	1.9	1.8	1.5	1.8	4.4	22	20
Total Suspended Solids	6	12	3.8	NA	279	NR	NR
Volatile Organic Compounds by EPA Method 8260B							
Chloroform	<0.12	0.15 t	<0.12	<0.12	ND		
All compounds below method detection limit:	ND	ND	ND	ND	ND	NR	NR

mg/l - milligrams per liter (parts per million)

µmhos/cm - micromhos per centimeter at 25 °C

NTU - Nephelometric Turbidity Units

µg/l - micrograms per liter (parts per billion)

t - Trace concentrations detected between the reporting limit and the detection limit. Results should be considered estimates only.

Concentration limits calculated using upstream location SW-4, through second quarter 2012.

NE - None established; insufficient data or too few detections.

ND - Non-detect

NR - Not required

LEGEND

- Groundwater monitoring well
- Destroyed groundwater monitoring well
- Piezometer
- ▲ Surface water sampling location
- Leachate sump
- Lysimeter
- Leak detection sump
- Landfill gas extraction / leachate well
- Landfill gas extraction well
- Landfill gas probe
- Groundwater elevation, ft MSL
- NM = not measured
- * Well G-22 is active groundwater extraction well.
- * Well G-21 not included in countouring (influenced by pumping).
- Deep wells (D-) not used in contouring.

- Existing Disposal Module Limit/Phase (DM-)
- Groundwater extraction trench
- Perimeter slurry wall

NOTES: All monitoring parameters listed above are required by regulations, permits, or regulatory agencies for the perimeter probes and structures but not for the interior probes. Monitoring is required at least quarterly. Evacuate 1 probe casing or achieve stable reading before recording. Calculate purge time based on probe depth, casing diameter, and pump rate. Provide GEM calibration sheet / information. Exceedances at perimeter probes (i.e., 5% methane by volume or greater) or structures (1.25% methane or greater) require immediate reporting to the Compliance Specialist as they also require immediate reporting to the LEA by telephone or email and a written report to the LEA within 7 days. Weather data can be obtained from the internet if not recorded in the field.

NOTES: All monitoring parameters listed above are required by regulations, permits, or regulatory agencies for the perimeter probes and structures but not for the interior probes. Monitoring is required at least quarterly. Record the GEM calibration information on the GEM calibration form. Provide it with this sheet to the Compliance Specialist. Measure the static pressure on the probe prior to obtaining a gas quality reading. Evacuate 1 probe casing or achieve a stable reading before recording. Refer to the purge time table to determine how long it will take to evacuate 1 casing volume. **Exceedances at perimeter probes (i.e., 5% methane by volume or greater) or structures (1.25% methane or greater) require IMMEDIATE reporting to the Compliance Specialist as they also require IMMEDIATE reporting to the LEA by telephone or email and a written report to the LEA within 7 days.** Weather data can be obtained from the internet if not recorded in the field.

Depths to water in feet

Operations Data
Recology Hay Road
First Semi-Annual 2012

Asbestos Disposal	10,767.53 tons in DM-1
Refuse Disposal	125,164.62 tons in DM's 3.2 and 3.3
Lowest waste placement	43.00 ft msl

Waste Pile Data

Type of Material	dewatered sludges
Quantity Discharged	33,670.13 tons or 37,411 cubic yards
Moisture Content	80-85 percent
Capacity Remaining	+/- 5%

Land Treatment Unit

Initial Depth	8-12 inches
Number of lifts	May – 1 lift June – 2 lifts
Quantity Discharged	May – 5113 tons or 5681 cubic yards June - 10,382 tons or 11,535 cubic yards

Location	Western portion of LTU and top of Disposal Modules 5 and 3.3
----------	--

Quantity Removed	May- 1203 tons or 1337 cubic yards June –2443 tons or 2714 cubic yards
Moisture Content	10-15 percent
Disposition	Stockpiled
Final Sludge Depth	0 inches
Area Covered	2 acres
Total Drying cycles	3
Cumulative LTU	2 acres

APPENDIX B
CERTIFIED ANALYTICAL REPORT COVER SHEETS (CARS ON ATTACHED CD)

Date of Report: 02/23/2012

Kris Johnson

Golder Associates

425 Lakeside Drive
Sunnyvale, CA 94085

Project: Hay Road LF

BC Work Order: 1201660

Invoice ID: B116868

Enclosed are the results of analyses for samples received by the laboratory on 1/30/2012. If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Contact Person: Linda Phoudamneun
Client Service Rep

Authorized Signature

Certifications: CA ELAP #1186; NV #CA00014

Notes And Definitions

- J Estimated Value (CLP Flag)
- MDL Method Detection Limit
- ND Analyte Not Detected at or above the reporting limit
- PQL Practical Quantitation Limit
- RPD Relative Percent Difference
- A01 PQL's and MDL's are raised due to sample dilution.
- A02 The difference between duplicate readings is less than the PQL.

Executive Summary - Detections

Table with 7 columns: Constituent, Result, PQL, MDL, Units, Method, Lab Quals. It contains 10 sections of data for different samples (1208257-01 to 1208257-05) with various chemical constituents and their measured values.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

All results listed in this report are for the exclusive use of the submitting party. BC Laboratories, Inc. assumes no responsibility for report alteration, separation, detachment or third party interpretation.

Executive Summary - Detections

Table with 7 columns: Constituent, Result, PQL, MDL, Units, Method, Lab Quals. It contains multiple rows of data grouped by sample ID and time, such as 1208257-05, 1208257-06, 1208257-07, 1208257-08, and 1208257-09.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

All results listed in this report are for the exclusive use of the submitting party. BC Laboratories, Inc. assumes no responsibility for report alteration, separation, detachment or third party interpretation.

Executive Summary - Detections

Table with 7 columns: Constituent, Result, PQL, MDL, Units, Method, Lab Quals. It lists multiple samples (1208257-09 to 1208257-14) with their respective chemical constituents and test results.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

All results listed in this report are for the exclusive use of the submitting party. BC Laboratories, Inc. assumes no responsibility for report alteration, separation, detachment or third party interpretation.

Notes And Definitions

- J Estimated Value (CLP Flag)
- MDL Method Detection Limit
- ND Analyte Not Detected at or above the reporting limit
- PQL Practical Quantitation Limit
- RPD Relative Percent Difference
- A01 PQL's and MDL's are raised due to sample dilution.
- A02 The difference between duplicate readings is less than the PQL.
- M03 Analyte detected in the Method Blank at a level between the PQL and the MDL.

Sunnyvale, CA 94085

Reported: 05/22/2012 11:48
Project: Hay Road LF
Project Number: 053-7444-11
Project Manager: Kris Johnson

Notes And Definitions

- J Estimated Value (CLP Flag)
- MDL Method Detection Limit
- ND Analyte Not Detected at or above the reporting limit
- PQL Practical Quantitation Limit
- RPD Relative Percent Difference
- A02 The difference between duplicate readings is less than the PQL.
- pH1:1 pH result reported on a 1:1 dilution of sample

Date of Report: 05/22/2012

Kris Johnson

Executive Summary - Detections

Table with 7 columns: Constituent, Result, PQL, MDL, Units, Method, Lab Quals. It contains five sections of data for different sampling events at Recology Hay Road, including parameters like Dichlorodifluoromethane, Alkalinity, Chloride, Sulfate, and various dissolved solids.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety. All results listed in this report are for the exclusive use of the submitting party. BC Laboratories, Inc. assumes no responsibility for report alteration, separation, detachment or third party interpretation.

Executive Summary - Detections

Constituent	Result	PQL	MDL	Units	Method	Lab Quals

Notes And Definitions

- J Estimated Value (CLP Flag)
- MDL Method Detection Limit
- ND Analyte Not Detected at or above the reporting limit
- PQL Practical Quantitation Limit
- RPD Relative Percent Difference
- A01 PQL's and MDL's are raised due to sample dilution.
- A02 The difference between duplicate readings is less than the PQL.

Project Name: Recology Hay Road

Project #: 053-7444-12

Workorder #: 1205392

Dear Mr. Steve Giacomini

The following report includes the data for the above referenced project for sample(s) received on 5/18/2012 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-15 are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kyle Vagadori at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kyle Vagadori
Project Manager

LABORATORY NARRATIVE
EPA Method TO-15
Golder Associates, Inc.
Workorder# 1205392

Three 6 Liter Summa Canister samples were received on May 18, 2012. The laboratory performed analysis via EPA Method TO-15 using GC/MS in the full scan mode.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

All Quality Control Limit exceedances and affected sample results are noted by flags. Each flag is defined at the bottom of this Case Narrative and on each Sample Result Summary page.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit.

UJ- Non-detected compound associated with low bias in the CCV and/or LCS.

N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

Summary of Detected Compounds

RE: 2011-2012 Annual Storm Water Report, Recology Hay Road, WDID: 5S48I010514

Dear Mr. Ditto,

On behalf of Recology Hay Road, Recology Environmental Solutions is submitting the enclosed 2011-2012 Annual Storm Water Report for Storm Water Discharges Associated with Industrial Activities.

Attachment A has been included with an explanation of all "no" responses in the annual report and with additional information on the authorized non-storm water discharge from the facility's borrow pit, clarification on parameters analyzed during the first sampling event, and additional BMPs implemented at the facility. In addition, a report prepared by SCS Engineers has been attached that addresses the slightly elevated specific conductance, iron, and aluminum in the facility's storm water discharge. The report is titled "Site Soil Analytical Results and Implications for Storm Water Benchmark Exceedances", Recology Hay Road, June 2011 and is being submitted as part of the facility's annual comprehensive site compliance evaluation.

If you have any questions or require additional information, please contact me at (707) 693-2108.

Sincerely,

A handwritten signature in black ink, appearing to read "G. Pryor", is written over the typed name.

Greg Pryor
General Manager

Enclosure

cc: Bryan Clarkson, Environmental Compliance Manager, Recology Environmental Solutions

STATE OF CALIFORNIA
STATE WATER RESOURCES CONTROL BOARD
2011-2012 ANNUAL REPORT
FOR STORM WATER DISCHARGES ASSOCIATED
WITH INDUSTRIAL ACTIVITIES

Reporting Period July 1, 2011 through June 30, 2012

An Annual Report is required to be submitted to your local Regional Water Quality Control Board (Regional Board) by July 1 of each year. This document must be certified and signed, under penalty of perjury, by the appropriate official of your company. Many of the Annual Report questions require an explanation. Please provide explanations on a separate sheet as an attachment. **Retain a copy of the completed Annual Report for your records.**

Please circle or highlight any information contained in Items A, B, and C below that is new or revised so we can update our records. Please remember that a Notice of Termination and new Notice of Intent are required whenever a facility operation is relocated or changes ownership.

If you have any questions, please contact your Regional Board Industrial Storm Water Permit Contact. The names, telephone numbers, and e-mail addresses of the Regional Board contacts, as well as the Regional Board Offices addresses are indicated below.

REGIONAL BOARD INFORMATION:

Central Valley Region

2011-2012
ANNUAL REPORT

SPECIFIC INFORMATION

MONITORING AND REPORTING PROGRAM

D. SAMPLING AND ANALYSIS EXEMPTIONS AND REDUCTIONS

1. For the reporting period, was your facility exempt from collecting and analyzing samples from **two** storm events in accordance with sections B.12 or 15 of the General Permit?

YES Go to Item D.2

NO Go to Section E

2. Indicate the reason your facility is exempt from collecting and analyzing samples from **two** storm events. Attach a copy of the first page of the appropriate certification if you check boxes ii, iii, iv, or v.

i. Participating in an Approved Group Monitoring Plan **Group Name:** _____

ii. Submitted **No Exposure Certification (NEC)** **Date Submitted:** _____

Re-evaluation Date: _____

Does facility continue to satisfy NEC conditions? **YES** **NO**

iii. Submitted **Sampling Reduction Certification (SRC)** **Date Submitted:** _____

Re-evaluation Date: _____

Does facility continue to satisfy SRC conditions? **YES** **NO**

iv. Received Regional Board Certification **Certification Date:** _____

v. Received Local Agency Certification **Certification Date:** _____

3. If you checked boxes i or iii above, were you scheduled to sample **one** storm event during the reporting year?

YES Go to Section E

NO Go to Section F

4. If you checked boxes ii, iv, or v, go to Section F.

E. SAMPLING AND ANALYSIS RESULTS

1. How many storm events did you sample? 2

If less than 2, **attach explanation** (if you checked item D.2.i or iii. above, only attach explanation if you answer "0").

2. Did you collect storm water samples from the first storm of the wet season that produced a discharge during scheduled facility operating hours? (Section B.5 of the General Permit)

YES

NO, **attach explanation** (Please note that if you do not sample the first storm event, you are still required to sample 2 storm events)

3. How many storm water discharge locations are at your facility? 1

4. For each storm event sampled, did you collect and analyze a sample from each of the facility's storm water discharge locations? YES, go to Item E.6 NO
5. Was sample collection or analysis reduced in accordance with Section B.7.d of the General Permit? YES NO, **attach explanation**
- If "YES", **attach documentation** supporting your determination that two or more drainage areas are substantially identical.
- Date facility's drainage areas were last evaluated _____
6. Were all samples collected during the first hour of discharge? YES NO, **attach explanation**
7. Was all storm water sampling preceded by three (3) working days without a storm water discharge? YES NO, **attach explanation**
8. Were there any discharges of stormwater that had been temporarily stored or contained? (such as from a pond) YES NO, go to Item E.10
9. Did you collect and analyze samples of temporarily stored or contained storm water discharges from two storm events? (or one storm event if you checked item D.2.i or iii. above) YES NO, **attach explanation**
10. Section B.5. of the General Permit requires you to analyze storm water samples for pH, Total Suspended Solids (TSS), Specific Conductance (SC), Total Organic Carbon (TOC) or Oil and Grease (O&G), other pollutants likely to be present in storm water discharges in significant quantities, and analytical parameters listed in Table D of the General Permit.
- a. Does Table D contain any additional parameters related to your facility's SIC code(s)? YES NO, Go to Item E.11
- b. Did you analyze all storm water samples for the applicable parameters listed in Table D? YES NO
- c. If you did not analyze all storm water samples for the applicable Table D parameters, check one of the following reasons:
- _____ In prior sampling years, the parameter(s) have not been detected in significant quantities from two consecutive sampling events. **Attach explanation**
- _____ The parameter(s) is not likely to be present in storm water discharges and authorized non-storm water discharges in significant quantities based upon the facility operator's evaluation. **Attach explanation**
- _____ Other. **Attach explanation**
11. For each storm event sampled, attach a copy of the laboratory analytical reports and report the sampling and analysis results using **Form 1** or its equivalent. The following must be provided for each sample collected:
- Date and time of sample collection
 - Name and title of sampler.
 - Parameters tested.
 - Name of analytical testing laboratory.
 - Discharge location identification.
 - Testing results.
 - Test methods used.
 - Test detection limits.
 - Date of testing.
 - Copies of the laboratory analytical results.

F. QUARTERLY VISUAL OBSERVATIONS

1. **Authorized Non-Storm Water Discharges**

Section B.3.b of the General Permit requires quarterly visual observations of all authorized non-storm water discharges and their sources.

a. Do authorized non-storm water discharges occur at your facility?

YES

NO

Go to Item F.2

*Authorized under General Order
RS-2008-0082-019 NPDES
permit no. CAG995002 issued
5/19/2011*

b. Indicate whether you visually observed all authorized non-storm water discharges and their sources during the quarters when they were discharged. **Attach an explanation for any "NO" answers.** Indicate "N/A" for quarters without any authorized non-storm water discharges.

July -September

YES

NO

N/A

October-December

YES

NO

N/A

January-March

YES

NO

N/A

April-June

YES

NO

N/A

c. Use **Form 2** to report quarterly visual observations of authorized non-storm water discharges or provide the following information.

- i. name of each authorized non-storm water discharge
- ii. date and time of observation
- iii. source and location of each authorized non-storm water discharge
- iv. characteristics of the discharge at its source and impacted drainage area/discharge location
- v. name, title, and signature of observer
- vi. **any** new or revised BMPs necessary to reduce or prevent pollutants in authorized non-storm water discharges. Provide new or revised BMP implementation date.

2. **Unauthorized Non-Storm Water Discharges**

Section B.3.a of the General Permit requires quarterly visual observations of all drainage areas to detect the presence of unauthorized non-storm water discharges and their sources.

a. Indicate whether you visually observed all drainage areas to detect the presence of unauthorized non-storm water discharges and their sources. **Attach an explanation for any "NO" answers.**

July -September

YES

NO

October-December

YES

NO

January-March

YES

NO

April-June

YES

NO

b. Based upon the quarterly visual observations, were any unauthorized non-storm water discharges detected?

YES

NO

Go to item F.2.d

c. Have each of the unauthorized non-storm water discharges been eliminated or permitted?

YES

NO

Attach explanation

d. Use **Form 3** to report quarterly unauthorized non-storm water discharge visual observations or provide the following information.

- i. name of each unauthorized non-storm water discharge.
- ii. date and time of observation.
- iii. source and location of each unauthorized non-storm water discharge.
- iv. characteristics of the discharge at its source and impacted drainage area/discharge location.
- v. name, title, and signature of observer.
- vi. **any** corrective actions necessary to eliminate the source of each unauthorized non-storm water discharge and to clean impacted drainage areas. Provide date unauthorized non-storm water discharge(s) was eliminated or scheduled to be eliminated.

G. MONTHLY WET SEASON VISUAL OBSERVATIONS

Section B.4.a of the General Permit requires you to conduct monthly visual observations of storm water discharges at all storm water discharge locations during the wet season. These observations shall occur during the first hour of discharge or, in the case of temporarily stored or contained storm water, at the time of discharge.

1. Indicate below whether monthly visual observations of storm water discharges occurred at all discharge locations. **Attach an explanation for any "NO" answers.** Include in this explanation whether any eligible storm events occurred during scheduled facility operating hours that did not result in a storm water discharge, and provide the date, time, name and title of the person who observed that there was no storm water discharge.

	YES	NO		YES	NO
October	<input checked="" type="checkbox"/>	<input type="checkbox"/>	February	<input checked="" type="checkbox"/>	<input type="checkbox"/>
November	<input checked="" type="checkbox"/>	<input type="checkbox"/>	March	<input checked="" type="checkbox"/>	<input type="checkbox"/>
December	<input checked="" type="checkbox"/>	<input type="checkbox"/>	April	<input checked="" type="checkbox"/>	<input type="checkbox"/>
January	<input checked="" type="checkbox"/>	<input type="checkbox"/>	May	<input checked="" type="checkbox"/>	<input type="checkbox"/>

2. Report monthly wet season visual observations using **Form 4** or provide the following information.
 - a. date, time, and location of observation
 - b. name and title of observer
 - c. characteristics of the discharge (i.e., odor, color, etc.) and source of any pollutants observed.
 - d. **any** new or revised BMPs necessary to reduce or prevent pollutants in storm water discharges. Provide new or revised BMP implementation date.

ANNUAL COMPREHENSIVE SITE COMPLIANCE EVALUATION (ACSCE)

H. ACSCE CHECKLIST

Section A.9 of the General Permit requires the facility operator to conduct one ACSCE in each reporting period (July 1-June 30). Evaluations must be conducted within 8-16 months of each other. The SWPPP and monitoring program shall be revised and implemented, as necessary, within 90 days of the evaluation. The checklist below includes the minimum steps necessary to complete a ACSCE. Indicate whether you have performed each step below. **Attach an explanation for any "NO" answers.**

1. Have you inspected all potential pollutant sources and industrial activities areas? YES NO
 The following areas should be inspected:
 - areas where spills and leaks have occurred during the last year.
 - outdoor wash and rinse areas.
 - process/manufacturing areas.
 - loading, unloading, and transfer areas.
 - waste storage/disposal areas.
 - dust/particulate generating areas.
 - erosion areas.
 - building repair, remodeling, and construction
 - material storage areas
 - vehicle/equipment storage areas
 - truck parking and access areas
 - rooftop equipment areas
 - vehicle fueling/maintenance areas
 - non-storm water discharge generating areas
2. Have you reviewed your SWPPP to assure that its BMPs address existing potential pollutant sources and industrial activities areas? YES NO
3. Have you inspected the entire facility to verify that the SWPPP's site map, is up-to-date? The following site map items should be verified: YES NO
 - facility boundaries
 - outline of all storm water drainage areas
 - areas impacted by run-on
 - storm water discharges locations
 - storm water collection and conveyance system
 - structural control measures such as catch basins, berms, containment areas, oil/water separators, etc.

4. Have you reviewed all General Permit compliance records generated since the last annual evaluation? YES NO

The following records should be reviewed:

- quarterly authorized non-storm water discharge visual observations
- monthly storm water discharge visual observation
- records of spills/leaks and associated clean-up/response activities
- quarterly unauthorized non-storm water discharge visual observations
- Sampling and Analysis records
- preventative maintenance inspection and maintenance records

5. Have you reviewed the major elements of the SWPPP to assure compliance with the General Permit? YES NO

The following SWPPP items should be reviewed:

- pollution prevention team
- list of significant materials
- description of potential pollutant sources
- assessment of potential pollutant sources
- identification and description of the BMPs to be implemented for each potential pollutant source

6. Have you reviewed your SWPPP to assure that a) the BMPs are adequate in reducing or preventing pollutants in storm water discharges and authorized non-storm water discharges, and b) the BMPs are being implemented? YES NO

The following BMP categories should be reviewed:

- good housekeeping practices
- spill response
- employee training
- erosion control
- quality assurance
- preventative maintenance
- material handling and storage practices
- waste handling/storage
- structural BMPs

7. Has all material handling equipment and equipment needed to implement the SWPPP been inspected? YES NO

I. ACSCE EVALUATION REPORT

The facility operator is required to provide an evaluation report that includes:

- identification of personnel performing the evaluation
- the date(s) of the evaluation
- necessary SWPPP revisions
- schedule for implementing SWPPP revisions
- any incidents of non-compliance and the corrective actions taken.

Use **Form 5** to report the results of your evaluation or develop an equivalent form.

J. ACSCE CERTIFICATION

The facility operator is required to certify compliance with the Industrial Activities Storm Water General Permit. To certify compliance, both the SWPPP and Monitoring Program must be up to date and be fully implemented.

Based upon your ACSCE, do you certify compliance with the Industrial Activities Storm Water General Permit?

- YES NO

If you answered "NO" **attach an explanation** to the ACSCE Evaluation Report why you are not in compliance with the Industrial Activities Storm Water General Permit.

ATTACHMENT SUMMARY

Answer the questions below to help you determine what should be attached to this annual report. Answer NA (Not Applicable) to questions 2-4 if you are not required to provide those attachments.

- 1. Have you attached Forms 1,2,3,4, and 5 or their equivalent? YES (Mandatory)
- 2. If you conducted sampling and analysis, have you attached the laboratory analytical reports? YES NO NA
- 3. If you checked box II, III, IV, or V in item D.2 of this Annual Report, have you attached the first page of the appropriate certifications? YES NO NA
- 4. Have you attached an explanation for each "NO" answer in items E.1, E.2, E.5-E.7, E.9, E.10.c, F.1.b, F.2.a, F.2.c, G.1, H.1-H.7, or J? YES NO NA

ANNUAL REPORT CERTIFICATION

I am duly authorized to sign reports required by the INDUSTRIAL ACTIVITIES STORM WATER GENERAL PERMIT (see Standard Provision C.9) and I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to ensure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those person directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

2011-2012 ANNUAL REPORT

DESCRIPTION OF BASIC ANALYTICAL PARAMETERS

The Industrial Activities Storm Water General Permit (General Permit) requires you to analyze storm water samples for at least four parameters. These are pH, Total Suspended Solids (TSS), Specific Conductance (SC), and Total Organic Carbon (TOC). Oil and Grease (O&G) may be substituted for TOC. In addition, you must monitor for any other pollutants which you believe to be present in your storm water discharge as a result of industrial activity and analytical parameters listed in Table D of the General Permit. There are no numeric limitations for the parameters you test for.

The four parameters which the General Permit requires to be tested are considered *indicator* parameters. In other words, regardless of what type of facility you operate, these parameters are nonspecific and general enough to usually provide some indication whether pollutants are present in your storm water discharge. The following briefly explains what each of these parameters mean:

pH is a numeric measure of the hydrogen-ion concentration. The neutral, or acceptable, range is within 6.5 to 8.5. At values less than 6.5, the water is considered acidic; above 8.5 it is considered alkaline or basic. An example of an acidic substance is vinegar, and a alkaline or basic substance is liquid antacid. Pure rainfall tends to have a pH of a little less than 7. There may be sources of materials or industrial activities which could increase or decrease the pH of your storm water discharge. If the pH levels of your storm water discharge are high or low, you should conduct a thorough evaluation of all potential pollutant sources at your site.

Total Suspended Solids (TSS) is a measure of the undissolved solids that are present in your storm water discharge. Sources of TSS include sediment from erosion of exposed land, and dirt from impervious (i.e. paved) areas. Sediment by itself can be very toxic to aquatic life because it covers feeding and breeding grounds, and can smother organisms living on the bottom of a water body. Toxic chemicals and other pollutants also adhere to sediment particles. This provides a medium by which toxic or other pollutants end up in our water ways and ultimately in human and aquatic life. TSS levels vary in runoff from undisturbed land. It has been shown that TSS levels increase significantly due to land development.

Specific Conductance (SC) is a numerical expression of the ability of the water to carry an electric current. SC can be used to assess the degree of mineralization, salinity, or estimate the total dissolved solids concentration of a water sample. Because of air pollution, most rain water has a SC a little above zero. A high SC could affect the usability of waters for drinking, irrigation, and other commercial or industrial use.

Total Organic Carbon (TOC) is a measure of the total organic matter present in water. (All organic matter contains carbon) This test is sensitive and able to detect small concentrations of organic matter. Organic matter is naturally occurring in animals, plants, and man. Organic matter may also be man made (so called synthetic organics). Synthetic organics include pesticides, fuels, solvents, and paints. Natural organic matter utilizes the oxygen in a receiving water to biodegrade. Too much organic matter could place a significant oxygen demand on the water, and possibly impact its quality. Synthetic organics either do not biodegrade or biodegrade very slowly. Synthetic organics are a source of toxic chemicals that can have adverse affects at very low concentrations. Some of these chemicals bioaccumulate in aquatic life. If your levels of TOC are high, you should evaluate all sources of natural or synthetic organics you may use at your site.

Oil and Grease (O&G) is a measure of the amount of oil and grease present in your storm water discharge. At very low concentrations, O&G can cause a sheen (that floating "rainbow") on the surface of water (1 qt. of oil can pollute 250,000 gallons of water). O&G can adversely affect aquatic life and create unsightly floating material and film on water, thus making it undrinkable. Sources of O&G include maintenance shops, vehicles, machines and roadways.

If you have any questions regarding whether or not your constituent concentrations are too high, please contact your local Regional Board office. The United States Environmental Protection Agency (USEPA) has published stormwater discharge benchmarks for a number of parameters. These benchmarks may be helpful when evaluating whether additional BMPs are appropriate. These benchmarks can be accessed at our website at <http://www.swrcb.ca.gov>. It is contained in the Sampling and Analysis Reduction Certification.

FORM 2-QUARTERLY VISUAL OBSERVATIONS OF AUTHORIZED NON-STORM WATER DISCHARGES (NSWDS)

- Quarterly dry weather visual observations are required of each authorized NSW.
- Observe each authorized NSW source, impacted drainage area, and discharge location.
- Authorized NSWDS must meet the conditions provided in Section D (pages 5-6), of the General Permit.
- Make additional copies of this form as necessary.

ANNUAL REPORT

FORM 3-QUARTERLY VISUAL OBSERVATIONS OF UNAUTHORIZED NON-STORM WATER DISCHARGES (NSWDs)

- Unauthorized NSWDs are discharges (such as wash or rinse waters) that do not meet the conditions provided in Section D (pages 5-6) of the General Permit.
- Quarterly visual observations are required to observe current and detect prior unauthorized NSWDs.
- Quarterly visual observations are required during dry weather and at all facility drainage areas.
- Each unauthorized NSWD source, impacted drainage area, and discharge location must be identified and observed.
- Unauthorized NSWDs that can not be eliminated within 90 days of observation must be reported to the Regional Board in accordance with Section A.10.e of the General Permit.
- Make additional copies of this form as necessary.

FORM 4-MONTHLY VISUAL OBSERVATIONS OF

STORM WATER DISCHARGES

- Storm water discharge visual observations are required for at least one storm event per month between October 1 and May 31.
- Visual observations must be conducted during the first hour of discharge at all discharge locations.
- Discharges of temporarily stored or contained storm water must be observed at the time of discharge.

- Indicate "None" in the first column of this form if you did not conduct a monthly visual observation.
- Make additional copies of this form as necessary.
- Until a monthly visual observation is made, record any eligible storm events that do not result in a storm water discharge and note the date, time, name, and title of who observed there was no storm water discharge.

Recology Hay Road
WDID No. 5S48I010514

2011-2012 Annual Report for Storm Water Discharges Associated with Industrial Activities

Attachment A

Explanations:

Item E-7 – Was all storm water sampling preceded by three working days of dry weather without a storm water discharge?

The 3/14/12 sampling event occurred during the second day of discharge due to the Oil & Grease bottle from the previous day's sampling (3/13/12) breaking in the cooler during transport.

Item F-1 – Authorized Non-Storm Water Discharges

The facility was authorized for dewatering of the site's borrow pit under a Limited Threat General WDR Order No. R5-2008-0082-019 and NPDES Permit No. CAG995002 (issued 5/19/11). Quarterly monitoring and sampling are submitted to the RWQCB in accordance with the General Order by the 1st day of the 2nd month following the calendar quarter.

Form 1 – Second Sampling Event

Due to breakage of the Oil & Grease bottle in the cooler during transport of the 3/13/12 sample, another sample was obtained the following day (3/14/12).

Form 5 – Annual Comprehensive Site Compliance Evaluation

The slightly elevated SC during both sample events is addressed in the attached report prepared by SCS Engineers (Site Soil Analytical Results and Implications for Storm Water Benchmark Exceedances, Recology Hay Road, June 2011).
